*This verification form is valid for up to five (5) years provided no material changes have been made to the structure or inaccuracies found on the form.

		Any system of screws, nails, adhesives, other deck fastening system or truss/rafter spacing that is shown to have an equivale or greater resistance than 8d common nails spaced a maximum of 6 inches in the field or has a mean uplift resistance of at lea 182 psf.		
		D. Reinforced Concrete Roof Deck.		
		E. Other:		
		F. Unknown or unidentified.		
		G. No attic access.		
4. Roof to Wall Attachment: What is the WEAKEST roof to wall connection? (Do not include attachment of hip/valley jacks 5 feet of the inside or outside corner of the roof in determination of WEAKEST type)				
		A. Toe Nails		
		Truss/rafter anchored to top plate of wall using nails driven at an angle through the truss/rafter and attached the top plate of the wall, or	to	
		☐ Metal connectors that do not meet the minimal conditions or requirements of B, C, or D		
	Mi	imal conditions to qualify for categories B, C, or D. All visible metal connectors are: Secured to truss/rafter with a minimum of three (3) nails, and		
		Attached to the wall top plate of the wall framing, or embedded in the bond beam, with less than a ½" gap from the blocking or truss/rafter and blocked no more than 1.5" of the truss/rafter, and free of visible severe corrosion.		
		B. Clips		
		\square Metal connectors that do not wrap over the top of the truss/rafter, or		
		Metal connectors with a minimum of 1 strap that wraps over the top of the truss/rafter and does not meet the nat position requirements of C or D, but is secured with a minimum of 3 nails.	il	
		C. Single Wraps Metal connectors consisting of a single strap that wraps over the top of the truss/rafter and is secured with minimum of 2 nails on the front side and a minimum of 1 nail on the opposing side.	a	
		D. Double Wraps		
		☐ Metal Connectors consisting of 2 separate straps that are attached to the wall frame, or embedded in the bond beam, on either side of the truss/rafter where each strap wraps over the top of the truss/rafter and is secured with a minimum of 2 nails on the front side, and a minimum of 1 nail on the opposing side, or	l	
		Metal connectors consisting of a single strap that wraps over the top of the truss/rafter, is secured to the wall on both sides, and is secured to the top plate with a minimum of three nails on each side.		
		E. Structural Anchor bolts structurally connected or reinforced concrete roof.		
		F. Other:		
		G. Unknown or unidentified		
		H. No attic access		
5.		of Geometry: What is the roof shape? (Do not consider roofs of porches or carports that are attached only to the fascia or wall be host structure over unenclosed space in the determination of roof perimeter or roof area for roof geometry classification).		
		A. Hip Roof Hip roof with no other roof shapes greater than 10% of the total roof system perimeter. Total length of non-hip features: feet; Total roof system perimeter: feet		
		B. Flat Roof Roof on a building with 5 or more units where at least 90% of the main roof area has a roof slope of less than 2:12. Roof area with slope less than 2:12 _17000 sq ft; Total roof area _17000 sq ft		
		C. Other Roof Any roof that does not qualify as either (A) or (B) above.		
6.		 A. SWR (also called Sealed Roof Deck) Self-adhering polymer modified-bitumen roofing underlayment applied directly to the sheathing or foam adhesive SWR barrier (not foamed-on insulation) applied as a supplemental means to protect the dwelling from water intrusion in the event of roof covering loss. B. No SWR. C. Unknown or undetermined. 	e

*This verification form is valid for up to five (5) years provided no material changes have been made to the structure or inaccuracies found on the form.

7. **Opening Protection:** What is the **weakest** form of wind borne debris protection installed on the structure? **First**, use the table to determine the weakest form of protection for each category of opening. Second, (a) check one answer below (A, B, C, N, or X) based upon the lowest protection level for ALL Glazed openings and (b) check the protection level for all Non-Glazed openings (.1, .2, or .3) as applicable.

Opening Protection Level Chart Place an "X" in each row to identify all forms of protection in use for each opening type. Check only one answer below (A thru X), based on the weakest form of protection (lowest row) for any of the Glazed openings and indicate the weakest form of protection (lowest row) for Non-Glazed openings.		Glazed Openings				Non-Glazed Openings	
		Windows or Entry Doors	Garage Doors	Skylights	Glass Block	Entry Doors	Garage Doors
N/A	Not Applicable- there are no openings of this type on the structure		Х	Х	X		Х
Α	Verified cyclic pressure & large missile (9-lb for windows doors/4.5 lb for skylights)						
В	Verified cyclic pressure & large missile (4-8 lb for windows doors/2 lb for skylights)						
С	Verified plywood/OSB meeting Table 1609.1.2 of the FBC 2007						
D	Verified Non-Glazed Entry or Garage doors indicating compliance with ASTM E 330, ANSI/DASMA 108, or PA/TAS 202 for wind pressure resistance						
N	Opening Protection products that appear to be A or B but are not verified						
IN	Other protective coverings that cannot be identified as A, B, or C						
Х	No Windborne Debris Protection	X				Х	

- A. Exterior Openings Cyclic Pressure and 9-lb Large Missile (4.5 lb for skylights only) All Glazed openings are protected at a minimum, with impact resistant coverings or products listed as wind borne debris protection devices in the product approval system of the State of Florida or Miami-Dade County and meet the requirements of one of the following for "Cyclic Pressure and Large Missile Impact" (Level A in the table above).
 - Miami-Dade County PA 201, 202, and 203
 - Florida Building Code Testing Application Standard (TAS) 201, 202, and 203

☐ A.1 All Non-Glazed openings classified as A in the table above, or no Non-Glazed openings exist

- American Society for Testing and Materials (ASTM) E 1886 and ASTM E 1996
- Southern Standards Technical Document (SSTD) 12
- For Skylights Only: ASTM E 1886 and ASTM E 1996
- For Garage Doors Only: ANSI/DASMA 115

X in the table above			
☐ A.3 One or More Non-Glazed Openings is classified as Level B, C, N, or X in the table above			
B. Exterior Opening Protection- Cyclic Pressure and 4 to 8-lb Large Missile (2-4.5 lb for skylights only) All Glaze			
openings are protected, at a minimum, with impact resistant coverings or products listed as windborne debris protection device in the product approval system of the State of Florida or Miami-Dade County and meet the requirements of one of the following for "Cyclic Pressure and Large Missile Impact" (Level B in the table above):			
• ASTM E 1886 <u>and</u> ASTM E 1996 (Large Missile – 4.5 lb.)			
• SSTD 12 (Large Missile – 4 lb. to 8 lb.)			
• For Skylights Only: ASTM E 1886 and ASTM E 1996 (Large Missile - 2 to 4.5 lb.)			
☐ B.1 All Non-Glazed openings classified as A or B in the table above, or no Non-Glazed openings exist			

A.2 One or More Non-Glazed openings classified as Level D in the table above, and no Non-Glazed openings classified as Level B, C, N, or

B.2 One or More Non-Glazed openings classified as Level D in the table above, and no Non-Glazed openings classified as Level C, N, or X in the table above

☐ B.3 One or More Non-Glazed openings is classified as Level C, N, or X in the table above

□ C. Exterior Opening Protection- Wood Structural Panels meeting FBC 2007 All Glazed openings are covered with plywood/OSB meeting the requirements of Table 1609.1.2 of the FBC 2007 (Level C in the table above).

C.1 All Non-Glazed openings classified as A, B, or C in the table above, or no Non-Glazed openings exist

C.2 One or More Non-Glazed openings classified as Level D in the table above, and no Non-Glazed openings classified as Level N or X in the table above

☐ C.3 One or More Non-Glazed openings is classified as Level N or X in the table above

Roof Mitigation Upgrade Report

The roof covering (i.e. shingles, tiles or metal panels) and the sheathing beneath it form one of your home's critical shields of protection from high winds and rain. When parts of the roof covering and sheathing below it blow away, the inside of your home becomes completely exposed to the elements. This significantly increases the risk to both life and property.

One of the purposes of this inspection is to document the presence or absence of certain attic and roof features that have proven to be valuable in high-wind conditions. While the age and condition of your current roof was *not* part of a windstorm mitigation inspection, certain items have been identified that in the future could increase your level of protection, as well as a potentially decrease your premium.

When it becomes necessary to replace your existing roof, an investment in the specific features outlined below should be discussed with a licensed professional. Your insurance agent can provide you with details of potential policy credits that may assist you in making your decision.

Roof-to-Wall Attachment Our report indicates that the existing roof-to-wall attachment(s) do not meet the requirements on the Uniform Mitigation Verification Inspection form for Single Wrap Straps. This definition requires at least two nails on the front side and at least one on the other of every strap in the attic, on every truss or rafter. As it is often difficult to access every truss or rafter, the ideal time to upgrade this feature is when the roof deck is being replaced. In some circumstances, this work can be done on its own; consult a professional for details. Retrofits to existing roof to wall connections should be permitted with the local building department, and installations should follow the manufacturer's guidelines.

Secondary Water Resistant ("SWR") Barrier. Our report indicates that your roof does not currently have 1) strips or sheets of a self-adhering modified bitumen barrier attached directly to the top of the roof deck sheathing, or 2) a high-strength, closed-cell foam adhesive barrier on all the seams throughout your attic. The presence of either of these types of valid SWR barriers provides increased protection against water intrusion. Before having your roof replaced, be sure to inquire of your roofing professional regarding the cost of these options.

Please contact DMI with questions about this report, or to schedule a re-inspection following the installation of one or more of these specific features. You should contact DMI at (800) 469-0434, and Press Option 1 to schedule a re-inspection. For customer service, you can:

- · Dial (800) 469-0434 and press Option 6,
- · Open a Live Chat with us at www.windstorminspections.com, or
- · Email us at research@dmifla.com

DMI thanks you for the opportunity to evaluate your home and present the ways in which you can help mitigate the unique risks associated with windstorms. It has been our pleasure to serve you.

Wall Construction Estimate

7480 Nw 17th St

Please note that at as a courtesy to your insurance agent or carrier, we have included below our estimate of the Wall Construction percentages of your home, classified between wood frame, masonry/concrete, or other wall construction types.

Wood Frame:	%
Masonry/Concrete:	100 %
Other	%

- DMI assumes no liability whatsoever for the accuracy of this wall construction estimate.
- These percentages are provided as a courtesy and on a best-efforts basis, based on a cursory survey of the property
 while separately performing a windstorm mitigation inspection. This estimated data was previously provided on the
 windstorm mitigation inspection itself, and as many industry participants would still like to see it along with the mitigation
 inspection, DMI has elected to voluntarily provide it.
- Note that per the guidelines provided by certain insurance carriers, 1) gable end walls are included in the above wall construction percentages, and 2) the openings associated with doors and windows are not taken into account when calculation the estimated percentages.
